## EXCEPTIONAL HELIUM CONCENTRATIONS OF OVER 3% AND 4% IN NEW BOREHOLES

---

Domestic natural gas and helium producer Renergen is pleased to announce it has now obtained laboratory results on the helium concentrations from recently drilled wells P007 and MDR1 (see ASX releases on 9 March and 11 March respectively).

MDR1 has returned a helium concentration of 3.15%, and wildcard well P007 a concentration of 4.38%.

The Company also wishes to advise investors that since the March 11 announcement the flow rate at MDR1 has increased by almost 90% to approximately 164,000 standard cubic feet per day, consistent with expectations as lost circulation drilling fluids introduced into the borehole dissipate and dry out.

“MDR1 is just 300 meters away from MDR5 and 600 meters from HDR1, which are both blowers with helium concentrations of ~2%, so getting a concentration of 3.15% was a very pleasant surprise. It will be interesting to see when and if the helium concentration reduces and stabilises in line with the nearby wells, but a key take-away from this excellent result is that despite the wells being so close, there does not appear to be any immediate interference between the wells which is a great result for our Reserve Update.

On P007, the team is ecstatic, and this exceeds anything we were hoping for. This is a big leap forward in corroborating our geological modelling of the Virginia Gas Project, and the potential additional supply of over 40kg of helium per day from a single well is quite an outstanding result,” said Stefano Marani, CEO.
